

USING OF THE SCIENCE AND TECHNOLOGY DEVELOPMENT FOR THE WINDING SHAFT IN UNDERGROUND MINES IN CZECH REPUBLIC

Jiří Havlík, Zdeněk Dejl, Hynek Přeček

VŠB- Technical University of Ostrava, Faculty of Mechanical Engineering
 17. listopadu 15, 708 33 Ostrava – Poruba, CZECH REPUBLIC

ABSTRACT: Underground mining of minerals and the consecutive vertical transport are on high level in Czech republic. The up-to-date pieces of knowledge of the science and research for technical innovations including the operation use are utilized.

ПРИЛОЖЕНИЕ НА НАУЧНО И ТЕХНОЛОГИЧНО РАЗВИТИЕ ПРИ ИЗВОЗНИ ШАХТИ НА ПОДЗЕМНИ МИННИ ИЗРАБОТКИ В ЧЕШКАТА РЕПУБЛИКА

Юри Хавлик, Зденек Дејл, Хайнек Пречек

VŠB – Технически Университет на Острава, Факултет по Механизирано инженерство
 17. Листопаду 15, 708 33 Острава – Поруба, Република Чехия

РЕЗЮМЕ: Подземният добив на полезни изкопаеми и последващо вертикално транспортиране са на високо равнище в Република Чехия. Използвани са успешно съвременни научно-изследователски познания и техническите нововъведения в практиката.

Introduction

The main mining equipments in the Czech republic deliver the raw materials (cole , uranus) from the depth of 800 (OKD,.a.s.) till 1400 m (Uran , s.p.). It is realised by the hoisting machines of the producer ŠKODA Plzeň (untill 1965), subsequently ČKD Praha (till 1998) and

Parameters:

now INCO Engineering. This is described as the mining equipment of the double drum type 2B6018, 2B6121 or the Koepe disc type (1K7008, 4K4016, or 4K5016) – see Table 1.1 and 1.2.

Footnotes:

Mining equipment according to transportation vessels: K-K cage – cage; K-P cage – counterweight; S-S skip – skip; S-P skip – counterweight; S-K skip – cage; K cage; HDZ emergency transport equipment; Drive: W-L Ward – Leonard; A – asynchronous; T - tyristor type of mining machine: 1B – one drum; 2B – double drum; 1K – one rope Koepe; 4K – four ropes Koepe. Parameters of mining: v – mining rate; Q – usable load of mining; H – mining depth of pit;

\emptyset – diameter of pit

3.2 The dynamics of the subsystem is also applied by the science and research at the department of parts of machines of the Engineering Fakulty - see Fig. 1.

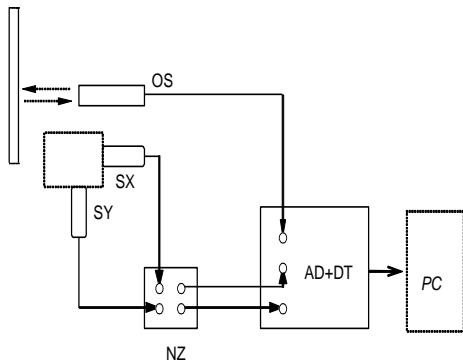

Fig.1

OS – optical device

SX – accelerometer in axis X

SY – accelerometer in axis Y

NZ – Feeding source of senzors and amplifiers

AD – analog – digital transducer

DT – data registration

PC – computer

The complex analysis of the subsystem is then the output which should meet the parameters in the Table 2.

Measurements are carried out separately with the empty transport vessels and with the highest allowed load, in both directions of transport. At the measuring procedure should the other equipment in the pit be stopped. Apart of accelerometer measurements the registration of the movement of transport vessel in the pit should be done with the accuracy at least ± 0.5 m. The result of experiments should be grafically evaluated separately for the frontal and side measurements with the presentation of localities with no satisfactory state. At the evaluation of the state we start from the position of the least positive result.

Table 2 – Accelerography measurements on transport vessels

- a) Measurements of horizontal acceleration in the front and side directions are carried out at the most allowed highest speed at the right way and at the mining procedure , as the speed is higher than 8 m/s.
- b) The values of horizontal acceleration for the evaluation of the state of directionality of the guiding of transport vessels:

Table 2

Value of front acceleration m/s	Value of side acceleration m/s	Evaluation of the state	Regulations
up to 3	up to 5	very good	not necessary
from 3 till 5	from 5 till 8	good	not necessary
from 5 till 8	from 8 till 10	not satisfactory	speed reduc.
Higher than 8	higher than 10	not acceptable	stop operation

Conclusion

At the VSB – Technical University of Ostrava have been elaborated several outputs of science and research for the main mining equipments in the Czech Republic.
